VICTORIA JUNIOR COLLEGE

The delicate flower in the picture is achieved by a simple polar equation. It attracts bees and butterflies that are overwhelmed by its beauty. I chose this picture because it reflects the beautiful symmetry and pattern of polar curves. To add more detail to it, I use parametric curves learnt from my senior to draw the bees and butterflies by suitable scaling and translating. I learnt new types of graphs that I have never seen before and also realized the powerful functions of the graphic calculator. How art is wonderfully expressed in mathematics!
